

FUND PROFILE

The Lynx Prime Opportunities Fund of Funds is a multi-managed fund that will consist of a mix of collective investment portfolios investing predominantly in equities. The fund may also invest in property, bond and money market collective investments in line with the portfolio objective. The fund is suitable for investors seeking exposure to the domestic equity market with maximum capital appreciation as their primary goal over the long term, and who have a higher risk appetite.

INVESTMENT OBJECTIVE

The objective of the Lynx Prime Opportunities Fund of Funds is to generate above average growth in capital over the medium to long term. Income generation will be a secondary objective of the portfolio.

ASSET ALLOCATION

Period (annualised)	01/01/2016	to	31/12/2016
	Total Expense Ratio (TER)	Transaction Costs (TC)	Total Investment Charges (TER + TC)
	1.85%	0.33%	2.18%
	of the value of the Financial Product was incurred as expenses relating to the administration of the Financial Product	of the value of the Financial Product was incurred as costs relating to the buying and selling of the assets underlying the Financial Product	of the value of the Financial Product was incurred as costs relating to the investment of the Financial Product.

A higher TER does not necessarily imply a poor return, nor does a low TER imply a good return. The current TER may not necessarily be an accurate indication of future TER's. Transaction Costs are a necessary cost in administering the Financial Product and impacts Financial Product returns. It should not be considered in isolation as returns may be impacted by many other factors over time including market returns, the type of Financial Product, the investment decisions of the investment manager and the TER. Inclusive in the TER of 1.85%, a performance fee of 0% of the net asset value of the class of Financial Product was recovered.

Disclaimer

This is a minimum disclosure document and a general investor report. Collective Investment Schemes are generally medium to long term investments. The value of participatory interests may go down as well as up. The manager does not provide any guarantee either with respect to the capital or the return of a portfolio. Past performance is not necessarily an indication of future performance. CIS's are traded at ruling prices and can engage in borrowing and scrip lending. Different classes of units apply to these portfolios and are subject to different fees and charges. A schedule of fees and charges and maximum commissions is available on request from the manager. The manager has a right to close portfolios to new investors in order to manage them more efficiently in accordance with their mandates. Forward pricing is used. The manager may borrow up to 10% of the market value of the portfolio to bridge insufficient liquidity. Actual investment performance will differ based on the initial fees applicable, the actual investment date and the date of reinvestment of income. Dealing prices are calculated on a net asset value and auditor's fees, bank charges and trustee fees are levied against the portfolios. Performance is calculated for the portfolio, as well as that the individual investor performance may differ as a result of initial fees, the actual investment date, the date of reinvestment and dividend withholding tax. Lump sum investment performances are quoted. Income distributions are in the calculations. NAV to NAV figures have been used. The investment performance is for illustrative purposes only. The investment performance is calculated after taking the actual initial fees and all ongoing fees into account. The reinvestment of income is calculated on the actual amount distributed per participatory interest by using the ex-dividend date NAV price of the applicable class of the portfolio, irrespective of the actual reinvestment date. Risk profile of the fund ranges from low risk to high risk with a low risk potentially associated with lower rewards and a high risk with potentially higher rewards. Foreign securities may be included in the portfolio from time to time and as such may result in the following: potential constraints on liquidity and the repatriation of funds; macroeconomic risks; political risks; foreign exchange risks; tax risks; settlement risks and potential limitations on the availability of market information. One can also obtain additional information on Prime products on the Prime CIS website and all price related queries or information is readily available on request. Fund of funds are portfolios that invests in portfolios of collective investment schemes that levy their own charges, which could result in a higher fee structure for the fund of funds. The daily cut off time is 14:00 for trades and the valuation point is 17:00. Prices are published on Finswitch by 10:00 daily. Prime Collective Investment Schemes Management Company (RF) (Pty) Ltd is registered as a Collective Investment Scheme Manager in terms of Section 5 of the Collective Investment Schemes Control Act and is a member of ASISA.

Fund/Market Commentary

As we reflect on the year in review, it's hard to grasp some of the events that took place. The two most outlandish events are well known, firstly the decision by Britain to leave the European Union, and secondly the US election in which Donald trumped Hillary Clinton.

Political events such as these, combined with the practices of global central banks which has resulted in compressed credit spreads and artificially inflated equity prices, have made it difficult for fundamental investors to make sense of the market. We are now in a world where investors invest in bonds to earn a capital gain while they look to equities to generate yield. This theme continued into 2016 but reversed in December as the Fed hiked rates for the first time in a year, and on the back of the Trump victory.

The 2016 scoreboard doesn't quite reflect many of the risks that were realised during the year. The S&P 500 ended the year up 10% after being down 12% in February. On the other hand, US bonds were up almost 5% in June but ended the year flat.

Fundamentally, emerging markets remained under pressure because of a sluggish global economic backdrop and a strong US dollar. However, the cyclical rotation in commodity prices from depressed levels in the previous year, led to major currency strength for commodity orientated countries. The rand was a great example of this because despite major political uncertainty, a weak economy, and a real chance of a credit downgrade to junk status, it strengthened by 13%.

Locally, South African investors earned handsome returns from cash and government bonds, but equities didn't fair nearly as well. With almost 50% of our equity market denominated by foreign assets, the currency translation impaired returns from companies with offshore interests. Having said that, there were segments of the market that performed particularly well, especially mining companies that started the year on a very low base.

The fourth quarter was a particularly good month for the Lynx Prime Opportunities fund which although marginally down, was well ahead on a relative basis, outperforming the local equity market. Despite the strong rally into the year end, the JSE ended the quarter down 2%. The fund remains well diversified across manager and sector, and should benefit from a continuation in an improving SA economy.

A fund of fund unit trust only invests in other unit trust, which levy their own charges, which could result in higher fee structures for these funds.

The manager shall reserve the right to close the portfolio to new investors on a date determined by the manager.

Glossary of Terms

Fund of funds

A "fund of funds" is an investment strategy of holding a portfolio of other investment funds rather than investing directly in stocks, bonds or other securities. This type of investing is often referred to as multi-manager investment. Investing in a fund of funds may achieve greater diversification. The benefit of diversification is that it can reduce volatility and the overall risk in the portfolio, while maintaining returns.

Risk Profile: High

You can afford to take on a higher level of risk (i.e. will have a greater exposure to equities in your portfolio) because of your investment time horizon or your appetite for risk. You know that in taking the risk, you need to be patient if you want to achieve the results. So you are willing to invest for the long-term and are prepared to tolerate some volatility in the short term, in anticipation of the higher returns you expect to receive in five years or beyond.

Liquidity

This is the ability to easily turn assets or investments into cash.

Equities

An equity or share represents an institution/individual's ownership in a listed company and is the vehicle through which they are able to "share" in the profits made by that company. As the company grows, and the expectation of improved profits increases, the market price of the share will increase and this translates into a capital gain for the shareholder. Similarly, negative sentiment about the company will result in the share price falling. Shares/equities are usually considered to have the potential for the highest return of all the investment classes, but with a higher level of risk i.e. share investments have the most volatile returns over the short term. An investment in this type of asset should be viewed with a 7 to 10 year horizon.

Total Expense Ratio (TER)

This is the total costs associated with managing and operating an investment (excluding administration, financial planning and servicing fees). These costs consist primarily of management fees and additional expenses such as trading fees, legal fees, auditor fees and other operational expenses. The total cost of the fund is divided by the fund's total assets under management to arrive at a percentage amount, which represents the TER.

Standard deviation

Standard deviation (also called monthly volatility) is a measure of how much the returns on an investment change from month to month. It is typically used by investors to gauge the amount of expected volatility in an investment.

Sharpe ratio

The Sharpe ratio measures risk-adjusted performance of an investment or portfolio. It measures the amount of risk associated with the returns generated by the portfolio and indicates whether a portfolio's returns are due to excessive risk or not. The greater a portfolio's Sharpe ratio, the better its risk-adjusted performance has been (i.e. a higher return with a contained risk profile, where the portfolio manager is not taking excessive risk to achieve those returns).

Annualised total returns

Annualised return is the weighted average compound growth rate over the period measured.

Compound rate of return (RoR)

The compounded rate of return is the average yearly (annualised) percentage that the fund has returned since the inception of the fund.

Sortino Ratio

The Sortino Ratio is similar to the Sharpe ratio in that it indicates the risk/reward profile of a fund based on past data. The difference is that the Sortino Ratio takes into account harmful volatility by taking into account the standard deviation of negative returns (downside deviation). A large ratio indicates a low probability of a large loss.

Downside deviation

A measure of downside risk that calculates the volatility on fund returns below a defined minimum. In this case, negative returns i.e. any monthly return below 0%.

Annual Returns (Highest/Lowest)

The highest and lowest annualised performance numbers are based on 10 non overlapping one year periods or the number of non overlapping one year periods from inception where performance history does not yet exist for 10 years.
